

DNR Sampling Shows Elevated Levels of PFAS Contamination in Fish and Surface Water in Starkweather Creek and Lake Monona

In the summer and fall of 2019, DNR collected surface water and fish tissue samples from Starkweather Creek and Lake Monona (see page 3 for a map), due to its proximity to known or suspected PFAS contamination sites. Surface water and fish samples were collected both upstream and downstream on Starkweather Creek near the Dane County and Truax Airport complexes, and in Lake Monona.

All the sampling and analysis data has been received by the DNR. The surface water sample results from the fall 2019 sampling event are available on page 4. The fish tissue results are available on page 5.

Special fish consumption advisory issued for Lake Monona and Starkweather Creek Because fish from most waters contain mercury, DNR and DHS provide statewide [safe eating guidelines for Wisconsin's inland waters](#). However, there are special exceptions to the safe eating guidelines for locations where higher levels of contaminants have been found in fish.

Before 2020, DNR and DHS issued special advice based on PFOS levels using meal threshold values developed in the early 2000s by the Minnesota Department of Health. DNR has recently adopted meal threshold values developed by the [Great Lakes Consortium for Fish Consumption Advisories](#), of which Wisconsin is a member. These revised values incorporate additional research on the toxicity of PFAS that has occurred in the intervening years.

Fish collected from Lake Monona and Starkweather Creek were found to contain higher levels of perfluorooctane sulfonate (PFOS). DNR and DHS are recommending that people consume some species of fish less frequently than the current safe eating guidelines.

Lake Monona		
Species	Up to 1 meal/week	Up to 1 meal/month
 Bluegill	All sizes	
 Common carp		All sizes
 Largemouth bass		All sizes
 Northern pike		All sizes
 Walleye		All sizes
 Yellow perch		All sizes

Starkweather Creek		
Species	Up to 1 meal/week	Up to 1 meal/month
 Bluegill	All sizes	
 Largemouth bass		All sizes
 Northern pike		All sizes
 Walleye		All sizes
 Yellow perch		All sizes

For more information, please read the full [handout about the new guidelines](#):

[PFAS Fish Advisory for Starkweather Creek and Lake Monona](#)

What about fish caught in other parts of the Madison chain of lakes?

At this time, this advisory is only applicable to fish caught from Lake Monona and Starkweather Creek.

Why did sampling in Starkweather Creek and Lake Monona occur?

To further assess PFAS contamination in Starkweather Creek and Lake Monona, the DNR did additional sampling of the creek and Lake Monona in October 2019. The original four surface water locations were sampled along with an additional eleven (11) along the creek or associated tributaries. Five (5) water samples were collected from Lake Monona. The sampling locations and PFOS/PFOA concentrations are shown on the map on page 3. Fish were collected from the creek and Lake Monona.

Results of October 2019 sampling

The October sampling shows that PFAS compounds are present throughout Starkweather Creek and Lake Monona in samples taken of both fish and surface water. Concentrations upstream of the airport show lower levels of PFAS contaminants present in surface water. The highest concentrations of PFAS in surface water were found in Starkweather Creek and tributaries in the areas adjacent to the airport complex. The concentrations of PFOS found ranged from less than 5 parts per trillion (ppt) to 3700 ppt.

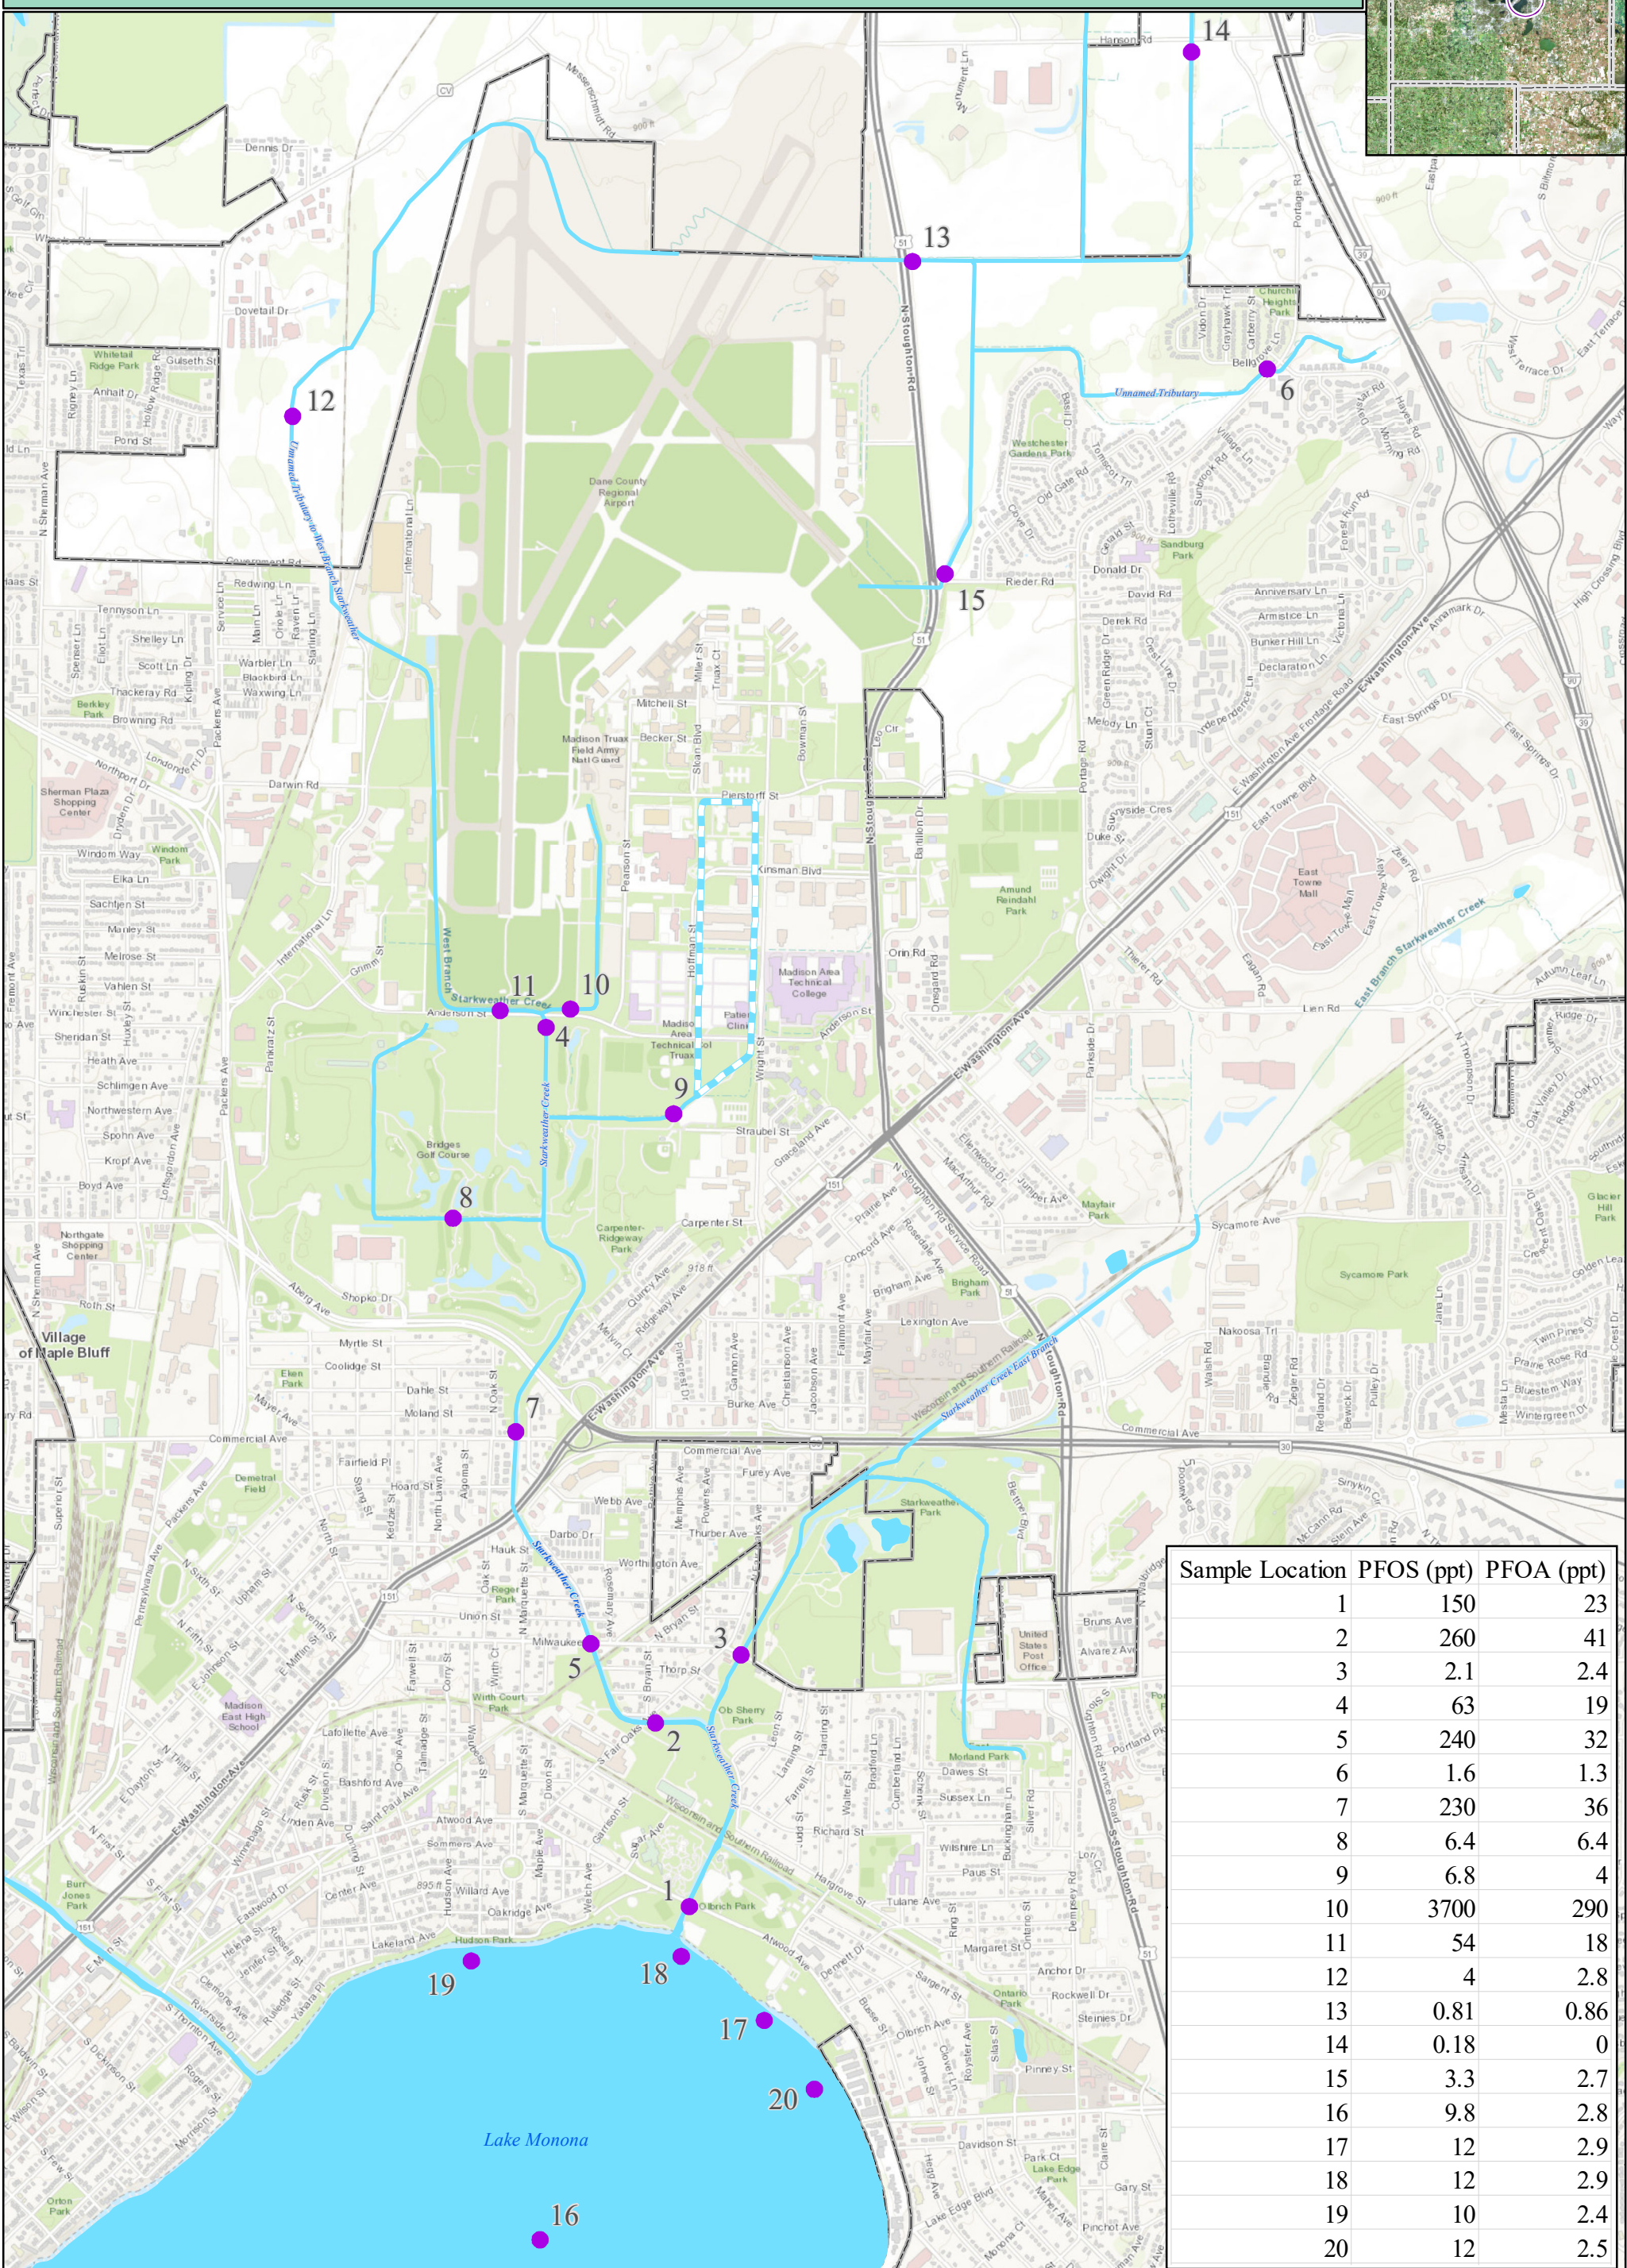

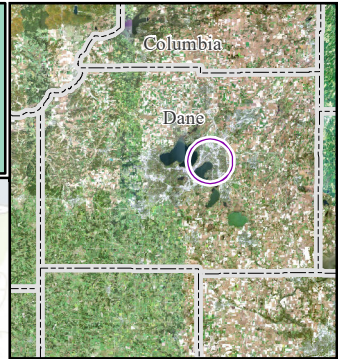

The samples from the west and east sides of the airport indicate that the airport complex is a source of PFAS contamination of Starkweather Creek. The October sampling results indicate that PFAS concentrations remain relatively consistent from Anderson Road until the East Branch joins the West Branch. At that point, there are lower concentrations of PFAS due to the two waterbodies joining together.

Surface water samples collected from Lake Monona were very consistent for PFOS and PFOA. Five (5) samples were collected from the lake, four near the mouth of Starkweather Creek and one further to the southwest away from any immediate effects of water from Starkweather entering the lake. The PFOS concentrations ranged 9.8-12 ppt and the PFOA concentrations ranged from 2.4-2.9 ppt.

Does Wisconsin have surface water quality standards for PFAS?

Wisconsin does not have a surface water standard for PFOS and PFOA, or for any PFAS compounds. The state of Michigan does have surface water standard for PFOS and PFOA for waters that are not drinking water sources. Neither Starkweather Creek nor Lake Monona are drinking water sources for the Madison Water Utility. The Michigan PFOS standard is 12 ppt and the PFOA standard is 12,000 ppt.

PFAS Surface Water Sampling: Starkweather Creek, City of Madison

Sample Location	PFOS (ppt)	PFOA (ppt)
